Contents

- What is Covidence?
  - Background
  - Current capabilities
- How does Covidence support Living Evidence?
  - Now
  - Soon
  - Later

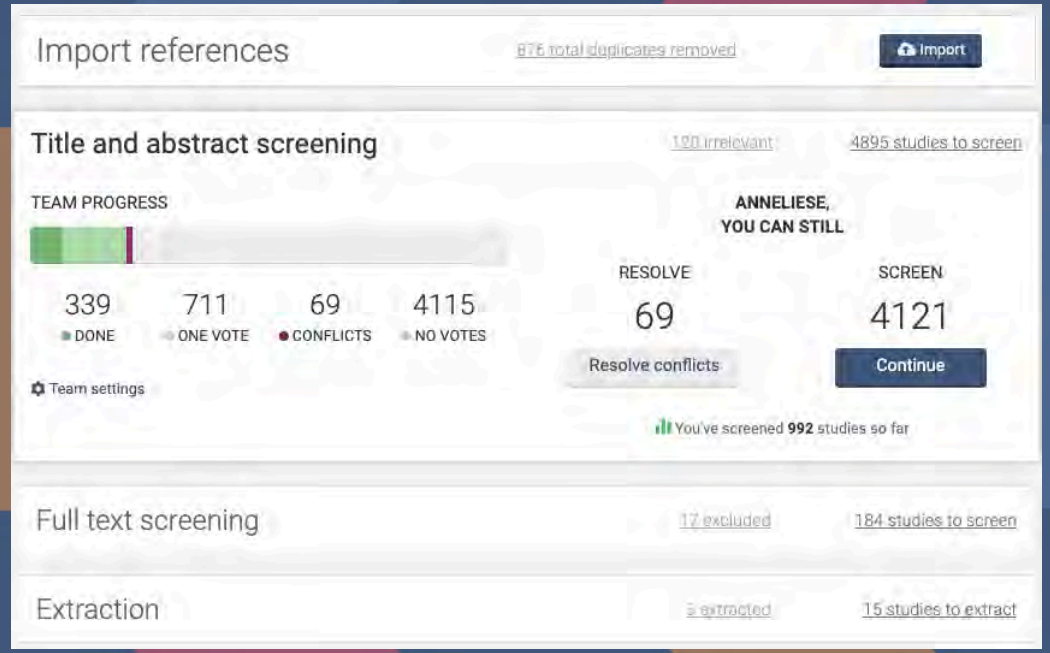
What is Covidence?

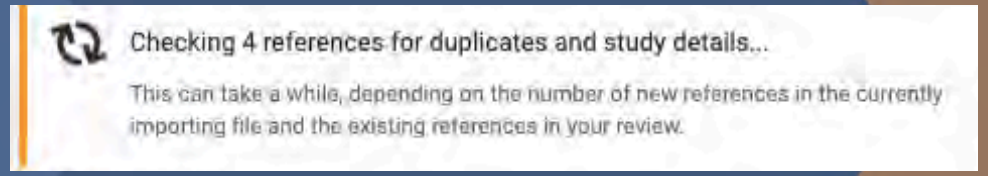
- Covidence is an online platform for systematic review production
- Our vision is a world shaped by the best evidence possible
- Our mission is to create tools to make systematic reviewing faster, easier, and more enjoyable
- Part of Cochrane toolkit

covidence

What can I do in Covidence?

- Covers the systematic review process from screening through the beginning of meta-analysis
- Currently can import EndNote formatted XML, or RIS text files
- Currently can export to RevMan 5 or to Excel





How does Covidence support Living Evidence?

- Reduction in time to create a review: average 35% efficiency gain
- Supporting review training through partnerships
  - Early career researchers
  - Low and Lower-middle income country partnerships

How does Covidence support Living Evidence?

- Available now:
  - Study triage
  - RCT classifier
- In progress:
  - Living PRISMA
  - CRS importer
  - RevMan Web integration
- Longer term ideas

Available now

Some context

- All Covidence reviews have three main stages: Title/Abstract Screening, Full Text Review, and Extraction
- During screening, customised tags may be added to studies

Study Triage

- Problem: researchers duplicating effort by having to screen each question separately
- Solution: allow for studies to be included in multiple reviews simultaneously
- Aim: increased data re-use

Study Triage

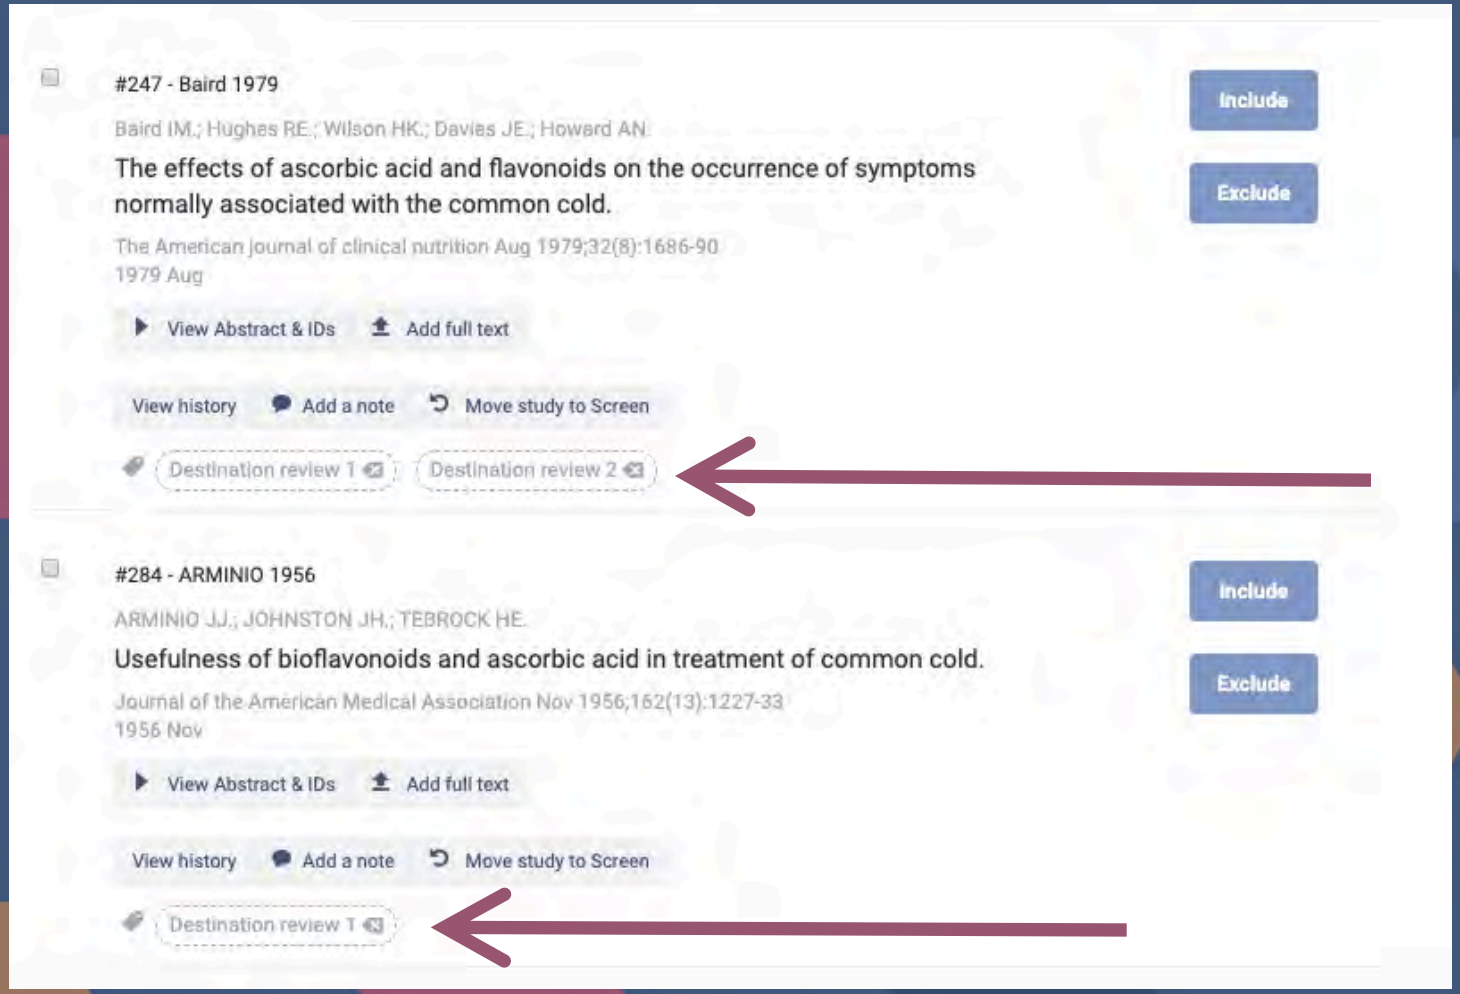
Tags present during Full Text Review

→

Included vote

→

Study imported to destination review(s)

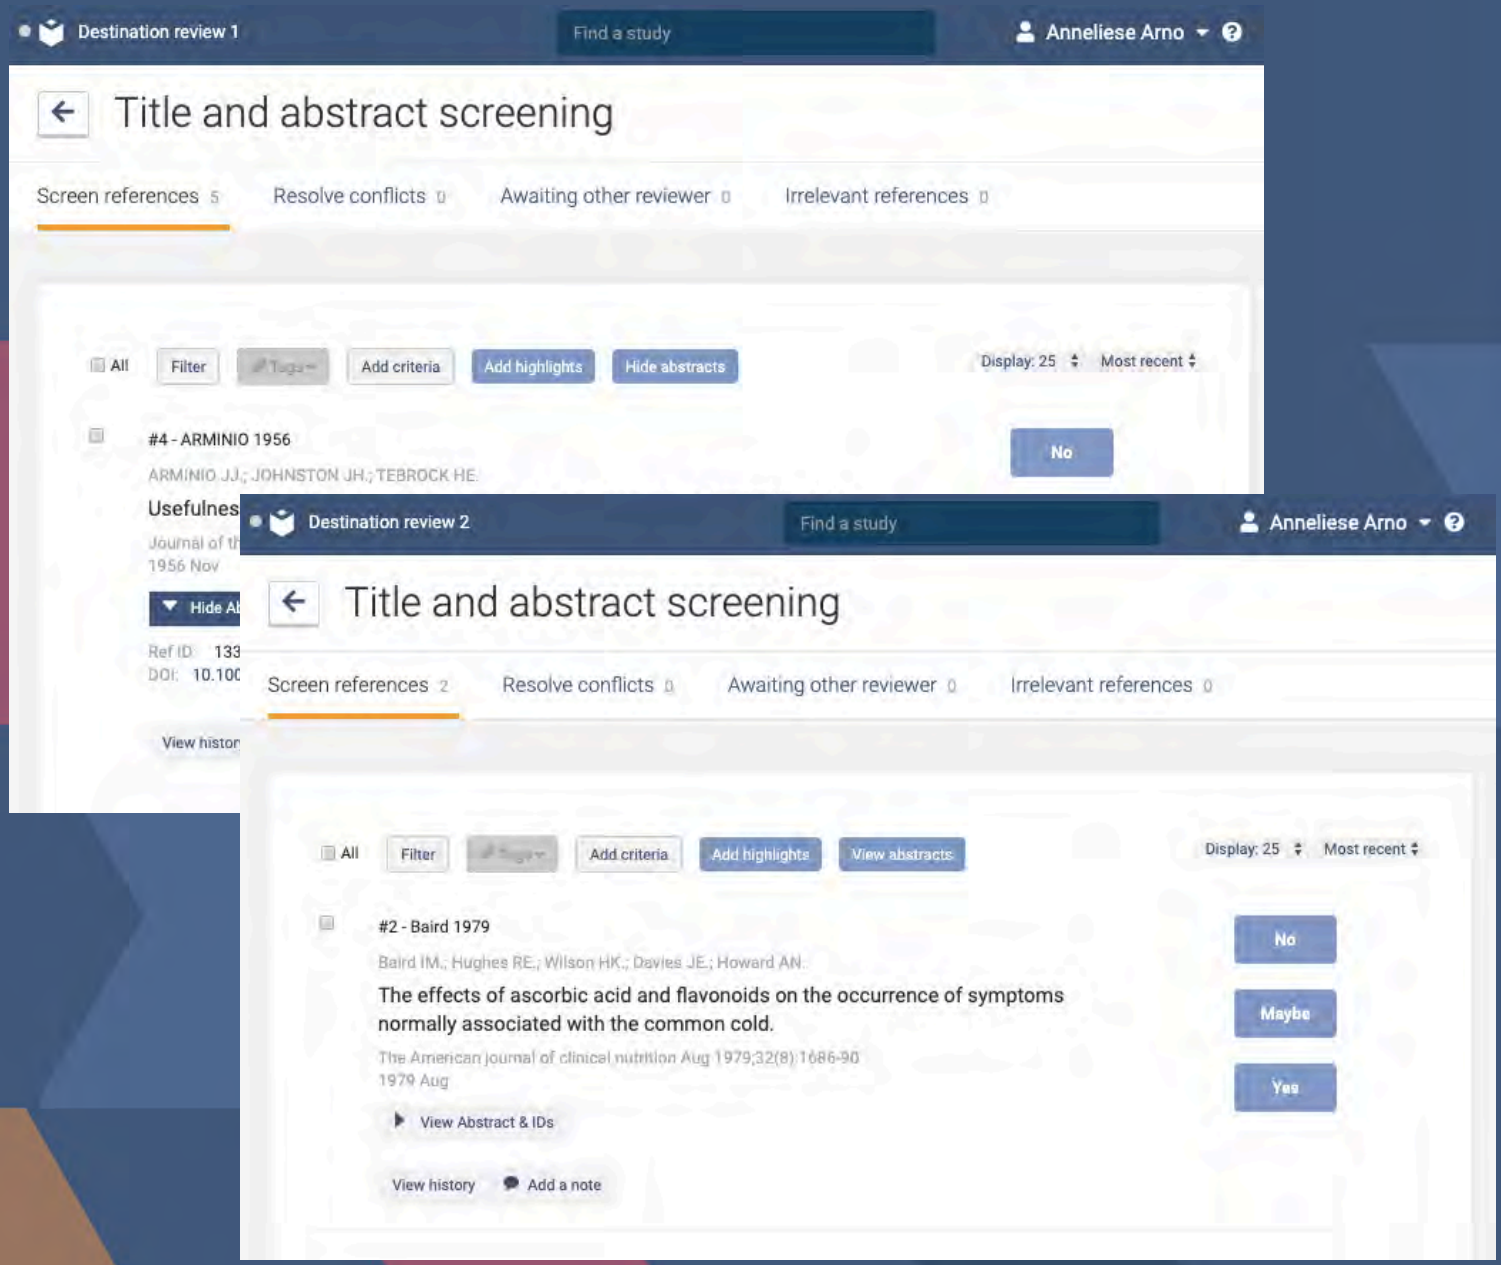


Study Triage

Currently in use for several living guidelines

To access:

- Contact support@covidence.org
- Name of review
- Names of destination reviews

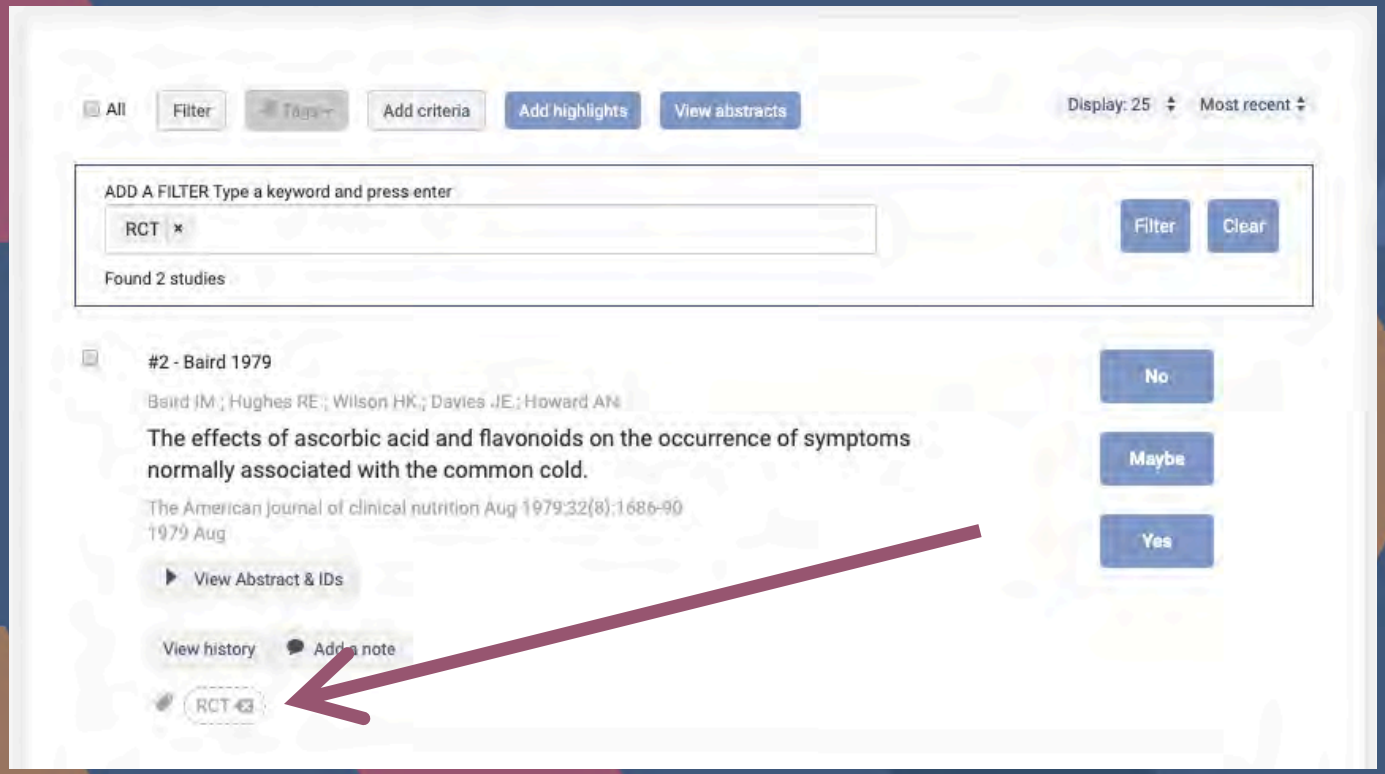


RCT classifier

- Problem: researchers spend too much time on screening
- Solution: Integrate Cochrane-developed machine assistance into Covidence screening
- Aim: faster screening
  - Previously demonstrated at 60-80% reduction in effort

RCT classifier

- Uses natural language processing assign score to studies
- Covidence creates “RCT” tag and applies it to studies with score of 99% or higher
- Tags can be used to filter screening list
- All voting still done by user



RCT classifier

- Currently active on several reviews
- To access:
  - Contact support@covidence.org
  - Name(s) of review(s)

In progress

Living PRISMA

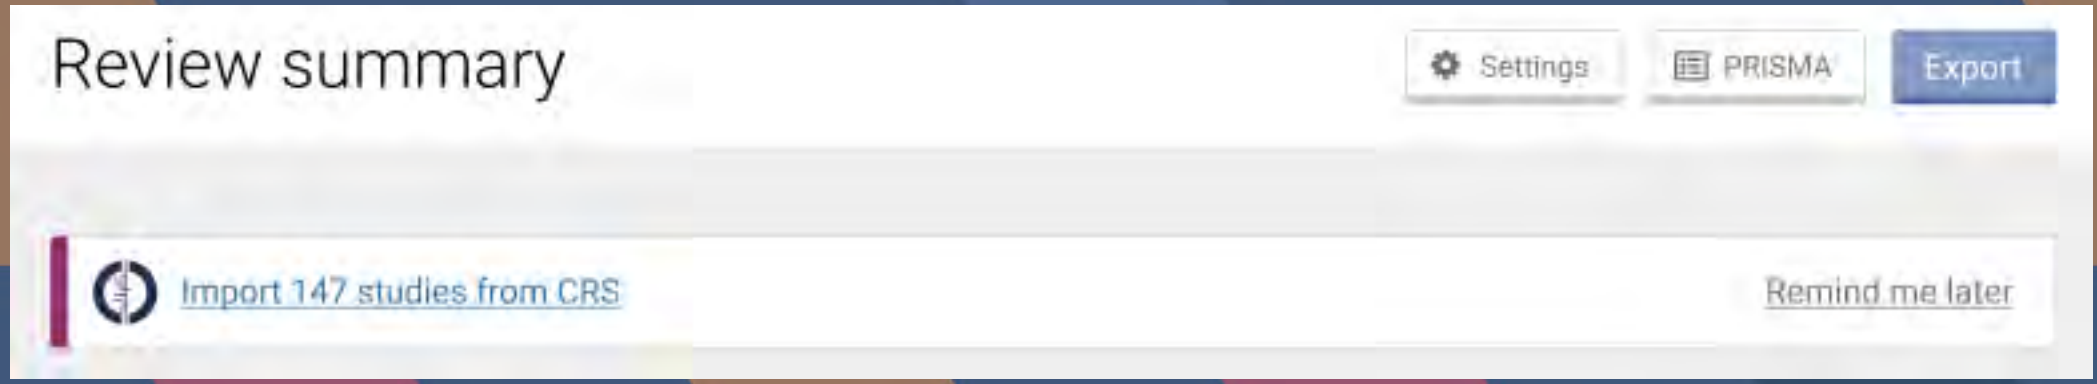
- Problem: reviewers are unsure of rate of eligible study publication
- Solution: store data over time relating to PRISMA flowchart
- Long term aim: allow users to view date-specific PRISMA

Living PRISMA: current state

- Covidence collects information on when citations are imported down to the day
- This data is stored in a spreadsheet
- To access this, please contact support@covidence.org

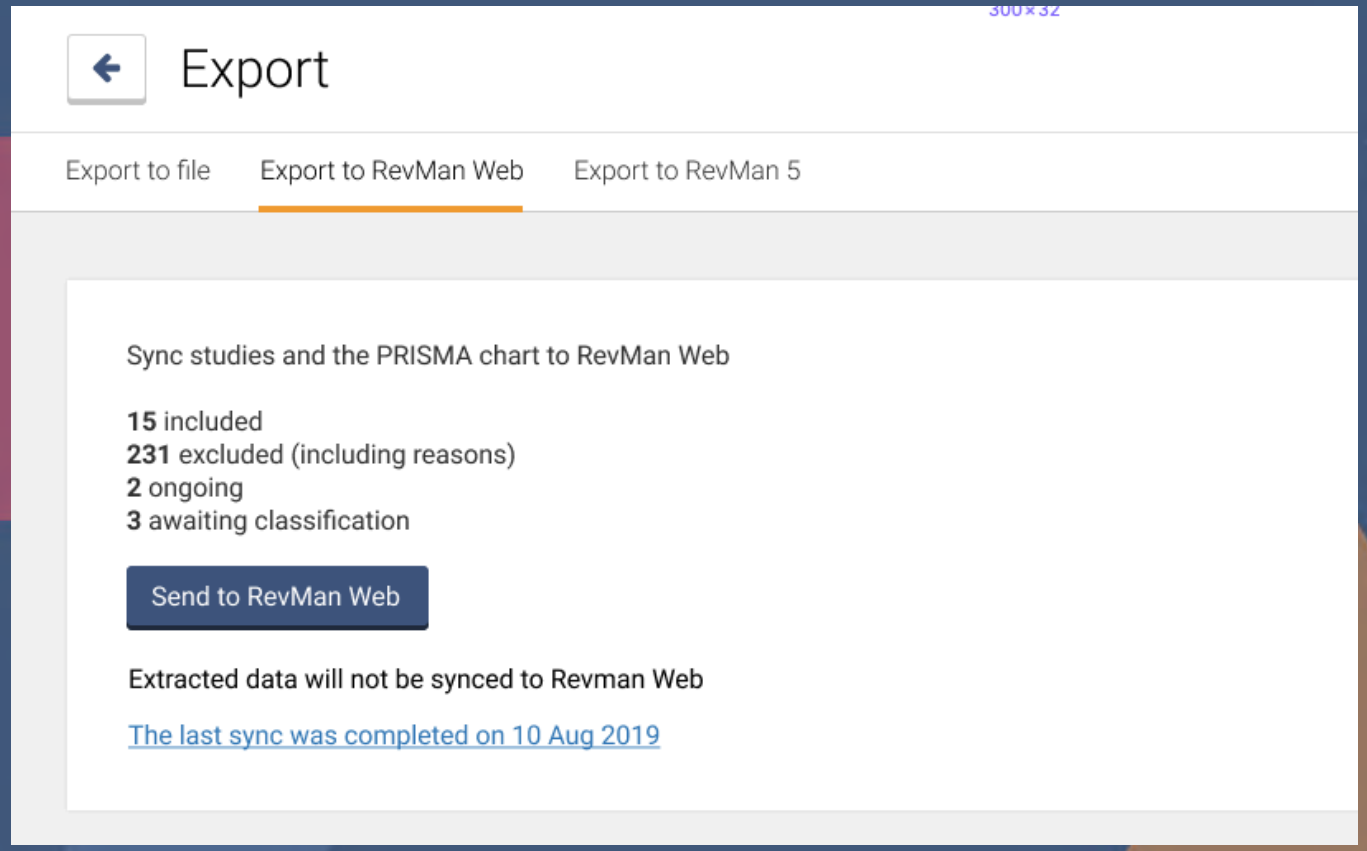
CRS import

- Problem: users are unaware of new studies to screen
- Solution: better integration between Covidence and CRS
- Long term aim: more timely screening updates



RevMan Web

- Problem: reviewers can't easily export data to existing reviews
- Solution: integration between Covidence and RevMan Web
- Aim: increased visibility of currency of data



Longer term ideas

- Covidence as a platform for collaboration
- Sharing of data and work
- Increased visibility of ongoing research
- More machine learning
- Crowd sourcing

Thank you!

Authoring & Publication Platform

MAGIC authoring and publication platform (MAGICapp) - for guidelines and evidence summaries - is developed through our research and innovation program.

The platform allows authors to write and publish their guidelines and evidence summaries in a highly structured fashion, using the GRADE methodology, new technology and a host of recent developed frameworks. MAGICapp is a web based collaborative tool that does not require any software installation and allows publication on all devices.

All researchers in MAGIC are practicing physicians devoted to evidence-based medicine and clinical epidemiology. We are also members of the GRADE working group and know from first hand experience that writing a guideline is a complex task and that many struggle with the methodology and the processes around.

MAGICapp includes features to guide you through the process of writing and publishing a guideline. A lot of research and effort has gone into improving the user interface of the platform – both for authors and readers.

Better health.

Cochrane and MAGIC announce partnership

Cochrane and MAGIC (http://magicproject.org/) are delighted to announce the launch of an official partnership, aimed at supporting and further strengthening the use of health evidence within the context of a digital and trustworthy evidence ecosystem for health care.

MAGIC (formally known as the MAking GRADE the Irresistible Choice (MAGIC) organization) is a non-profit research and innovation programme set up to make evidence summaries and recommendations that work for clinicians at the point of care and to facilitate shared decision-making with patients. Established in 2010, the MAGIC project has, among a number of other initiatives, developed the MAGICapp, a web-based platform for preparing guidelines using structured data systems and validated methods.

Cochrane and MAGIC wish to continue a history of working together by establishing a formal partnership to harmonize the flow of data from systematic reviews to guidelines development and decision support systems. To this end, the organizations have signed a Memorandum of Understanding to structure and focus our collaborative work for the next three years.

Mark Wilson, Cochrane CEO, said: 'We are delighted to be deepening our relationship with MAGIC through this new partnership. Cochrane and MAGIC share a passion for innovation, collaboration and commitment to making health and healthcare evidence more accessible and usable. I'm excited that by

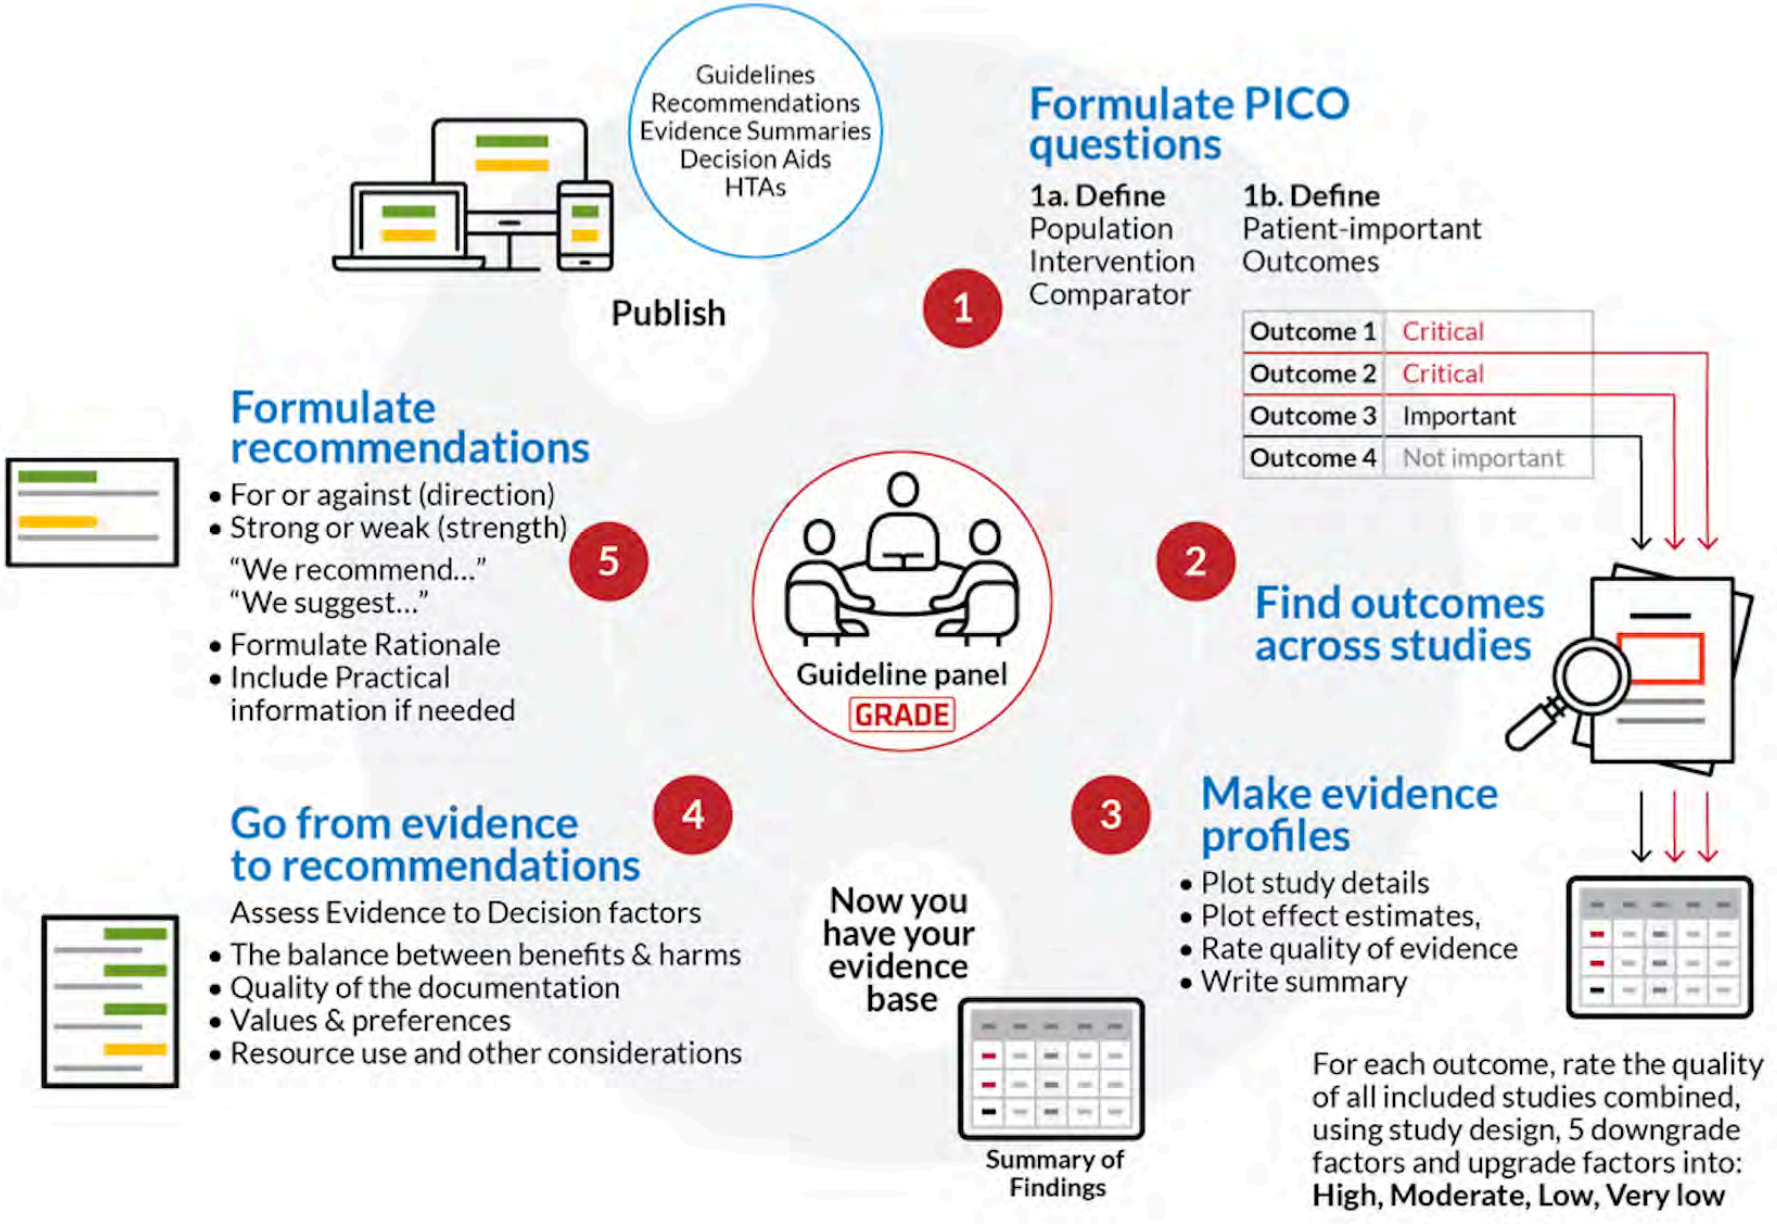
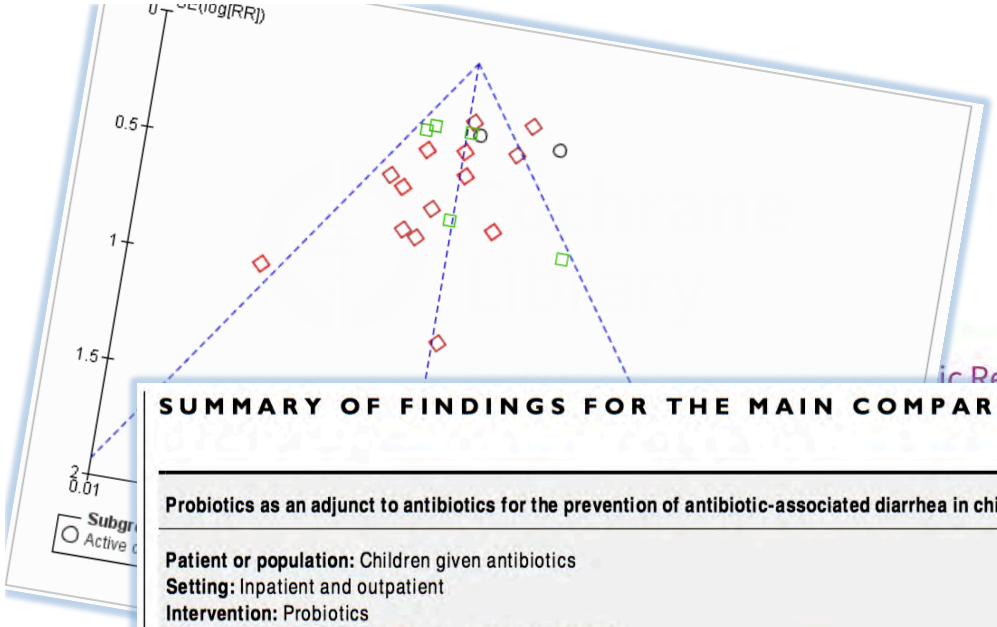
Guideline development in MAGICapp





SUMMARY OF FINDINGS FOR THE MAIN COMPARISON *[Explanation]*

Probiotics as an adjunct to antibiotics for the prevention of antibiotic-associated diarrhea in children

Patient or population: Children given antibiotics
Setting: Inpatient and outpatient
Intervention: Probiotics
Comparison: Control (placebo or no active treatment)

Outcomes	Anticipated absolute effects* (95% CI)		Effect size (95% CI)	Number of participants (studies)	Quality of the evidence (GRADE)	Comments
	Risk with control	Risk with Probiotics				
Incidence of diarrhea Follow up: range 1 week to 12 weeks	191 per 1000	88 per 1000 (67 to 116)	RR 0.46 (0.35 to 0.61)	3898 (22 RCTs)	⊕⊕⊕◯ MODERATE[1,2]	
Adverse events Follow up: range 1 week to 4 weeks	35 per 1000	33 per 1000 (15 to 72)	RD 0.00 (-0.01 to 0.01)	2455 (16 RCTs)	⊕◯◯◯ VERY LOW[3,4,5]	
Duration of diarrhea Follow up: range 10 days to 12 weeks		The mean duration of diarrhea in the intervention group was 0.6 days fewer (1.18 fewer to 0.02 fewer)		897 (5 RCTs)	⊕⊕◯◯ LOW[6,7]	
Stool frequency Follow up: range 10 days to 12 weeks		The mean stool frequency in the intervention group was 0.3 lower (0.6 lower to 0)		425 (4 RCTs)	⊕⊕◯◯ LOW[,8,9]	

***The risk in the intervention group** (and its 95% confidence interval) is based on the assumed risk in the comparison group and the **relative effect** of the intervention (and its 95% CI).

CI: Confidence interval; **RR:** Risk ratio; **RD:** Risk difference;

Strong recommendation

Children 1 month to 2 years old receiving antibiotics for an infection.

Evidence profile | Summary | References

Outcome Timeframe	Study results and measurements	Absolute effect estimates No probiotics	 Probiotics	Certainty in effect estimates (Quality of evidence)	Summary
AAD <2 years	Relative risk 0.46 (CI 95% 0.35 - 0.61) Based on data from 3898 patients in 22 studies Follow up: 1-12 weeks.	**180** per 1000	**83** per 1000 Difference: 97 fewer per 1000 (CI 95% 117 fewer - 70 fewer)	**Moderate** Due to serious inconsistency.	Probiotics appear to decrease the incidence of AAD.
Severe AAD <2 years	0.46 (0.35 - 0.61) Based on data from 3898 patients in 22 studies Follow up: 1-12 weeks.	**18** per 1000	**8** per 1000 Difference: 10 fewer per 1000 (CI 95% 12 fewer - 7 fewer)	**Low** Due to serious inconsistency and indirectness.	Probiotics may decrease the incidence of severe AAD by a small amount.
GI side effects	Relative risk 1 (CI 95% 0.71 - 1.29) Based on data from 2455 patients in 16 studies Follow up: 1-4 weeks.	**35** per 1000	**35** per 1000 Difference: 0 fewer per 1000 (CI 95% 10 fewer - 10 more)	**Moderate** Due to serious indirectness.	Probiotics do not appear to increase the risk of gastrointestinal side effects.
Probiotic-related sepsis	Relative risk 1 (CI 95% -) Based on data from 2455 patients in 16 studies Follow up: 1-4 weeks.	**0** per 1000	**0** per 1000 Difference: 0 more per 1000 (CI 95% 0 - 3 more)	**Moderate** No probiotic-related sepsis events reported in the 16 of 22 studies reporting adverse events. Rated down due to risk of bias from selective outcome reporting.	Probiotics do not appear to increase the risk of sepsis.
Clostridium difficile diarrhea	Relative risk 0.4 (CI 95% 0.17 - 0.96) Based on data from 605 patients in 3 studies Follow up: 2 weeks.	**59** per 1000	**24** per 1000 Difference: 35 fewer per 1000 (CI 95% 49 fewer - 2 fewer)	**Very Low** Due to serious imprecision, risk of bias (possible selective outcome reporting), and indirectness in baseline estimate.	Probiotics could reduce the risk of CDAD.

Probiotics for children receiving antibiotics for an infection

Children 1 month to 2 years old receiving antibiotics for an infection.

Strong recommendation

GRADE

Benefits outweigh harms for almost everyone. All or nearly all informed patients would likely want this option.

We recommend adjunctive probiotics rather than no probiotics.

Children 2 to 18 years old receiving antibiotics for an infection.

Weak recommendation

GRADE

Benefits outweigh harms for the majority, but not for everyone. The majority of patients would likely want this option

We suggest adjunctive probiotics rather than no probiotics.

MAGIC app

Strong recommendation **Children 1 month to 2 years old receiving antibiotics for an infection.**

Benefits and harms

Benefits of probiotics include a reduced incidence of antibiotic associated diarrhea (AAD), severe AAD, and *Clostridium difficile*-associated diarrhea (CDAD). Among otherwise healthy children, probiotics do not increase the risk of gastrointestinal side effects or of probiotic-related sepsis.

Quality of evidence

For probiotics, we have moderate certainty that the estimated effects for reduced incidence of AAD, gastrointestinal side effects, and probiotic-related sepsis are close to the true effects, low certainty for severe AAD, and very low certainty for CDAD.

Preference and values

Patients and their caregivers are likely to place a relatively higher value on preventing AAD, particularly severe AAD than on the relatively minimal costs and burden of probiotics.

Resources and other considerations

Probiotics are generally inexpensive and accessible throughout the world. Many caregivers with lower disposable income, particularly those without socialized pharmacare or private insurance, may not have the means to afford probiotics.

Weak recommendation

Children 2 to 18 years old receiving antibiotics for an infection.

Evidence profile | Summary | References

Outcome Timeframe	Study results and measurements	Absolute effect estimates No probiotics	 Probiotics	Certainty in effect estimates (Quality of evidence)	Summary
AAD 2-18 years	Relative risk 0.46 (CI 95% 0.35 - 0.61) Based on data from 3898 patients in 22 studies Follow up: 1-12 weeks.	**30** per 1000	**14** per 1000 Difference: 16 fewer per 1000 (CI 95% 19 fewer - 12 fewer)	**Moderate** Due to serious inconsistency.	Probiotics appear to decrease the incidence of AAD by a small amount.
Severe AAD 2-18 years	Relative risk 0.46 (CI 95% 0.35 - 0.61) Based on data from 3898 patients in 22 studies Follow up: 1-12 weeks.	**3** per 1000	**1** per 1000 Difference: 2 fewer per 1000 (CI 95% 2 fewer - 1 fewer)	**Low** Due to serious inconsistency and indirectness.
